What is alternator air-inlet ductwork?

he alternators as shown in ternator air-inlet (Ducting)Any ductwork that is to be used to supply cooling air to inlet for the alternatormust be designed such that it allows this quantity of air to flow with a maximum pressure drop across the Air-in ductwork [with alte

How much incoming air does a generator need?

A generator typically needs 35-40% over-sizingof the incoming air based on the internal generator inlet air temperature being ambient +20 degrees Celsius. For typical 32 degrees Celsius water,there is no de-rate for single-wall application. The generator requires this amount of air for cooling purposes. For example,for every kilowatt of loss,the required flow is 1 gallon per minute.

What is ernator air outlet ductwork?

ernator air-outlet (Ducting)The air outlet ductwork must again be designed to incorporate no 90o sharp bends,and be of a cross sectional area designed in conjunction with the ductwork overall length,such that the pressure drop across the ductwork with the alternator ru

How many air cooled generators are there?

More than 130 generators of these new designs have been shipped through the end of 1992, with approximately on -half in service. Theair-cooled generator product line iscontin-uing to evolve. The generator that is being applied with the LM6000 aeroderivative gas tur-bine (Figure 13) was tested and shipped in 1992.
