

Are flexible photovoltaics (PVs) beyond Silicon possible?

Recent advancements for flexible photovoltaics (PVs) beyond silicon are discussed. Flexible PV technologies (materials to module fabrication) are reviewed. The study approaches the technology pathways to flexible PVs beyond Si. For the previous few decades, the photovoltaic (PV) market was dominated by silicon-based solar cells.

Can perovskite-silicon tandem solar cells reduce diffusion-length phase segregation?

Recently, an independently certified PCE of 25.7% for perovskite-silicon tandem solar cells was reported to have reduced the diffusion-length phase segregation. The textured c-Si was fabricated by alkaline wet-chemical etching (Figure 20 d), which changed the perovskite morphology and film thickness.

Do flexible SHJ modules address load-bearing issues in building-integrated photovoltaics?

The flexible SHJ modules demonstrated in this study may address the load-bearing issue encountered in the fast-growing research field of building-integrated photovoltaics and enable c-Si solar modules to be attached to building walls with either flat or curved surfaces.

How is a flexible PV device prepared?

Reproduced with permission from ref. . Spin-coating techniques are the most appropriate film preparation methods for flexible PV devices. Normally, spin coating is performed at room temperature. Materials (typically liquids) are dropped onto the center of a rotating substrate driven by a mechanical vacuum motor.

What is flexible PV technology?

Flexible PV technologies require highly functional materials, compatible processes, and suitable equipment. The highlighting features of flexible PV devices are their low weight and foldability. Appropriate materials as substrates are essential to realize flexible PV devices with stable and excellent performance.
