

Can Latvia use clean electricity to decarbonise other economic sectors?

Latvia's hydro-dominated electricity system provides a favourable starting point to use clean electricity to decarbonise other economic sectors. Moreover, given Latvia's historic dependence on energy imports from Russia, its transition to clean energy sources offers an important opportunity to bolster energy security and lower energy prices.

How much energy does Latvia use?

Latvia is a net energy importer. Primary energy use in Latvia was 49 TWh, or 22 TWh per million persons in 2009. In 2018, electricity consumption per capita was 3731 kWh. Latvia has adopted the EU target to produce 50% of its energy from renewable sources by 2030.

Can Latvia achieve energy savings by renovating its building stock?

Latvia could achieve considerable energy savings by renovating its building stock. Latvia holds considerable potential to accelerate energy efficiency outcomes in the buildings sector, which will go a long way toward meeting climate targets and lowering energy bills.

Will electricity be the cornerstone of Latvia's energy transition?

Electricity will be the cornerstone of Latvia's energy transition. Latvia's hydro-dominated electricity system provides a favourable starting point to use clean electricity to decarbonise other economic sectors and meet the target of 57% renewables in total final consumption by 2030.

How can wind and solar power projects help Latvia?

Bringing wind and solar power projects online will also help reduce Latvia's dependence on natural gas imports and can contribute to lower electricity prices; current efforts to develop offshore wind will support this outcome.

What is Sege Solar Energy Group Europe?

The SEGE Solar Energy Group Europe focuses on the conservation of the necessary land areas as grassland in its open space solar power plants. Solar power plants require large open spaces. Mostly fallow areas with poor soil quality or lack of water are used for this, on which agricultural use is unprofitable.

This Energy Policy Review was prepared in partnership between the Government of Latvia and the IEA. It draws on the IEA's extensive knowledge and the inputs of expert peers from IEA member countries to assess Latvia's most pressing energy sector challenges and provide recommendations on how to address them, backed by international best ...

At Solar Energy Group Europe (SEGE), we believe in creating solar power plants that are not only efficient but also ecologically sustainable. Our philosophy is rooted in the principle of balance--balancing the need for

renewable energy ...

Diversification of energy supplies 1. Key actions Import dependency from Russian natural gas was 100% in 2021 (equalling 1.2 bcm). Latvia has outlawed Russian gas imports starting in January 2023. (1) According to preliminary Eurostat information, gas-fired electricity generation in Latvia fell by 857 GWh, or 42%, in 2022 compared to 2021.

developing areas. Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8,760h/year. Avoided

Latvia is a net energy importer. Primary energy use in Latvia was 49 TWh, or 22 TWh per million persons in 2009. In 2018, electricity consumption per capita was 3731 kWh. Latvia has adopted the EU target to produce 50% of its energy from renewable sources by 2030.

Kosovo's Prime Minister Albin Kurti said the project is an important step towards its clean energy transition. The construction of the solar park in the village of Bec, which will be built and operated by a group of ...

Latvia holds considerable potential to accelerate energy efficiency outcomes in the buildings sector, which will go a long way toward meeting climate targets and lowering energy bills. Latvia's energy demand is dominated by an ageing ...

Latvia holds considerable potential to accelerate energy efficiency outcomes in the buildings sector, which will go a long way toward meeting climate targets and lowering energy bills. Latvia's energy demand is dominated by an ageing building stock, which accounts for nearly half of total final consumption, with residential buildings alone ...

SEGE is subsidiary of the Rockland Group, an active investor in the solar energy production sector in 16 different countries and actively involved in the production of solar modules. We produce electricity from solar energy with an ...

On November 1 Latvia's largest wind energy producer Utilitas Wind opened the first utility-scale battery energy storage battery system in Latvia with a total power of 10 MW and capacity of 20 ...

Welcome Message. 2025 IEEE the 13th International Conference on Smart Energy Grid Engineering (SEGE 2025) will be held during August 18- 20, 2025 at Ontario Tech University, Oshawa, Canada. This premier conference will ...

Latvia's energy system is largely based on renewable resources, primarily hydropower from the Daugava River, supplemented by wind, solar, and biomass. While natural gas imports cover energy shortages, the country aims to increase wind and solar energy capacity, with significant progress already made in 2022.

SEFE Energy is de salestak van SEFE, een internationaal energiebedrijf dat zorgt voor leveringszekerheid en de decarbonisatie van haar klanten stimuleert. De activiteiten van SEFE bestrijken de energiewaardeketen, van productie en ...

SEGE is subsidiary of the Rockland Group, an active investor in the solar energy production sector in 16 different countries and actively involved in the production of solar modules. We produce electricity from solar energy with an economical, ecological, emission-free process

On November 1 Latvia's largest wind energy producer Utilitas Wind opened the first utility-scale battery energy storage battery system in Latvia with a total power of 10 MW and capacity of 20 MWh in Targale, Ventspils region.

Latvia is a net energy importer. Primary energy use in Latvia was 49 TWh, or 22 TWh per million persons in 2009. [1] In 2018, electricity consumption per capita was 3731 kWh. [2] Latvia has adopted the EU target to produce 50% of its energy from renewable sources by 2030. [3]
