

Do smart distribution grids need Operations Centers for effective system management?

Smart distribution grids will require innovative operations centers for effective system management. ABB has been continuously working to define and develop integrated operations centers for smart distribution grids, including advanced integration of existing systems and the development of new applications.

How a SCADA system can help a smart grid?

One of the considerations in designing the capabilities of the smart grid is the integration of SCADA systems to enable the remote control of electric microgrids and grids, supervise and control the electric network equipment as a means of fulfilling reliability and desired efficiencies for the whole utility.

What makes a smart grid an effective system?

A smart grid should be responsive to the current load on the power system. The model is comparable with life subsystems (blood system, nervous system, muscular system) whose mutual interactions allow for their high performance, economic operation, and high reliability.

How can cloud distributed infrastructure help a smart grid implementation?

Cloud distributed infrastructure can help assist in achieving the goal of moving the industry from manual to optimized and adaptive demand response management for Smart Grid implementations. This is done by partitioning consumers into clusters and alleviating privacy concerns.

What are the risk factors for cloud based smart grid system?

For a cloud based smart grid system, the three major risk factors are security, performance, and reliability. Many of the benefits of Clouds come with their own set of challenges, several of which are unique to the Smart Grid domains.

What are the execution policies for cloud & smart grids?

These execution policies for cloud and smart grids will have to intelligently use available computing capacity at the private Cloud and clusters available with the utilities, and make dollar cost tradeoffs of enlisting additional computing power in commercial Clouds against the KW or power curtailed. (5. Clouds and smart grids: state of the art and future challenges)
