

Photovoltaic inverter iso detection

What causes PV isolation protection?

The causes of 'PV Isolation Protection' are mainly divided into three categories: external environmental factors (increased environmental humidity), system factors (poor system ground insulation), inverter factors (DC line insulation detection and protection threshold is too small).

How to test a PV inverter?

Method: turn off the inverter, remove all PV strings, and use DC gear of multi-meter to measure the DC voltage of string to the ground. Multi-meter red test lead is connected to PV string positive or negative, and the black test lead is grounded. Observe whether its DC voltage is reduced to less than 20V.

What is PV ISO-PR?

In this Solis Seminar, we will use this case to introduce issues related to 'PV ISO-PR'. 'PV ISO-PR' means PV Isolation Protection, which is a relatively frequent problem of the system, which is mainly manifested as: the inverter is disconnected from the grid and enters the protection mode.

How do I know if my inverter has an Isolation Fault?

You can identify an isolation fault using either SetAPP or the inverter LCD display. An isolation fault may disappear and recur after a short period (especially if it is caused by morning moisture), therefore it is recommended to troubleshoot the fault as soon as it occurs before it disappears.

What is a PV inverter?

PV inverter is considered as the brain of the PV system. Studies have demonstrated that it is the most vulnerable component. Inverter failures are classified into different categories: Manufacturing and design problems: PV inverter performance depends on operating conditions and the system lightning.

What does PV iso-pr01/02 mean?

It's screen displays the error message of 'PV ISO-PR01/02'. Reason: This fault indicates that the inverter has detected that the PV+ or PV- insulation resistance to the ground is too low. According to safety regulations, the inverter must stop working and enter the protection mode to prevent the risk of electric shock.
