Do you have problems with your solar panels?

Nearly seven in 10 owners had had no problems with their solar panels in our survey of over 2,000 owners.* The most common - and most serious - problem owners face is with the inverter. In some cases inverter problems mean you don't get any usable renewable electricity. It can also be a pricey problem to fix.

What defects are common when testing solar panels?

The following defects are common when testing solar panels: Lower output than stated in data sheet (we require positive tolerance on each solar panel) Other defects that we find are dirt marks on the pv module, gaps on the corner of the pv frame, poor quality labels and solar panels that do not meet the requirement of positive tolerance.

Do solar panels have defects?

Regardless in which country your solar panels are produced, solar panel defects occur on a regular basis. The payback performance of a solar PV systems is based, besides FITs and irradiation, on the initial power output, power degradation and the lifetime of the pv module (s).

What is solar panel degradation?

Solar panel degradation comprises a series of mechanisms through which a PV module degrades and reduces its efficiency year after year. Aging is the main factor affecting solar panel degradation, this can cause corrosion, and delamination, also affecting the properties of PV materials.

Why do solar panels have a bad output?

Scratches or breakages of any kind can lead to output degradation, and even more technically, the way solar panels are wired internally and externally (to the inverter) can lead to decreased output as well, a problem that typically arises in the manufacturing or installation process.

Why do solar panels deteriorate?

This occurs by solar panel frames corroding, glass and back-sheet delamination, and PV materials losing their properties, all of these cause the average 0.5% yearly degradation for PV modules.
