What is design of solar thermal power plants?

Design of Solar Thermal Power Plants introduces the basic design methods of solar thermal power plants for technicians engaged in solar thermal power generation engineering. This book provides a full description. Since the beginning of the 21st century, energy and environmental problems have become increasingly more conspicuous.

What is solar thermal power generation?

Harnessing solar energy for electric power generation is one of the growing technologies which provide a sustainable solution to the severe environmental issues such as climate change, global warming, and pollution. This chapter deals with the solar thermal power generation based on the line and point focussing solar concentrators.

What is concentrated solar power (CSP) & thermal energy storage (TES)?

Concentrated solar power (CSP) is a promising technology to generate electricity from solar energy. Thermal energy storage (TES) is a crucial element in CSP plants for storing surplus heat from the solar field and utilizing it when needed.

Can solar thermal power plants be integrated with conventional power plants?

Solar thermal power plants have enormous potential to be integrated with the existing conventional power plants. The integration of CSP systems with conventional power plants increases the efficiency, reduces the overall cost, and increases the dispatchability and reliability of the solar power generation system.

How can solar thermal components reduce the cost of electricity generation?

Advancements in the design of the solar thermal components improve the performance and consequently reduce the cost of electricity generation. This chapter discusses all the available CSP technologies and highlights the various design and operational parameters on which the overall efficiency of the solar power plants depends.

What is a solar thermal power plant with PTC?

Schematic of typical solar thermal power plant with PTC In central receiver systems and also called as power tower systems, an array of dual-axis tracking-based reflectors (heliostats) placed on the ground focus sun rays at the receiver mounted on the centrally located tower (shown in Fig. 3.12).

A schematic diagram showing the main components of a central receiver power plant in which water is heated to produce steam. The diagram includes the following components: Incident solar energy, Central receiver, Heliostats, Turbine, Alternator, Condenser, and Pump.
