What is the future of solar energy?

The Future of Solar Energy considers only the two widely recognized classes of technologies for converting solar energy into electricity -- photovoltaics (PV) and concentrated solar power (CSP), sometimes called solar thermal) -- in their current and plausible future forms.

How will the future of solar energy be shaped?

Changes across the wider energy system, like the increased electrification of buildings and vehicles, emergence of clean fuels, and new commitments to both equitability and a more circular, sustainable economy, will shape the future of solar energy.

Will solar power continue to grow in 2050?

Photovoltaics (PV) and concentrating solar power are likely to continue to grow rapidly--the National Renewable Energy Laboratory (NREL) projects solar energy could provide 45% of the electricity in the United States by 2050 if the energy system is fully decarbonized--and technology costs are projected to continue to decline.

What is the solar futures study?

View SETO's goals. Explore SETO's research in soft costs and systems integration. The Solar Futures Study is a U.S Department of Energy report that explores the role of solar energy in achieving the goals of a decarbonized grid by 2035 and a decarbonized energy system by 2050.

Will solar become more affordable by 2030?

In the coming years,technology improvements will ensure that solar becomes even cheaper. It could well be that by 2030, solar will have become the most important source of energy for electricity production in a large part of the world. This will also have a positive impact on the environment and climate change.

Are solar photovoltaics ready to power a sustainable future?

Nat. Energy 3,515-527 (2018). Victoria,M. et al. Solar photovoltaics is ready to power a sustainable future. Joule vol. 5 1041-1056 (Cell Press,2021). Nemet,G. How solar energy became cheap: a model for low-carbon innovation. (Taylor &Francis,2019). Rogers,E. Diffusion of Innovations. (Free Press,2003). Farmer,J. D. &Lafond,F.

Solar cells will in all likelihood be the single biggest source of electrical power on the planet by the mid 2030s. By the 2040s they may be the largest source not just of electricity but of...

Solar power's share of global electricity generation will rise to 13% by 2030 and to 25% by 2050, according to the International Renewable Energy Agency. And prices will keep falling for the energy they produce. Two ...
