Can a transformer-less inverter cause DC current leakage to ground?

In photovoltaic systems with a transformer-less inverter, the DC is isolated from ground. Modules with defective module isolation, unshielded wires, defective Power Optimizers, or an inverter internal fault can cause DC current leakage to ground (PE - protective earth). Such a fault is also called an isolation fault.

What is a fault in a photovoltaic system?

Faults in any components (modules, connection lines, converters, inverters, etc.) of photovoltaic (PV) systems (stand-alone, grid-connected or hybrid PV systems) can seriously affect the efficiency, energy yield as well as the security and reliability of the entire PV plant, if not detected and corrected quickly.

What is an Isolation Fault in a SolarEdge system?

Modules with defective module isolation, unshielded wires, defective power optimizers, or an inverter internal fault can cause DC current leakage to the Ground (PE - protective earth). Such a fault is also called an isolation fault. This document describes how to identify and locate an isolation fault in a SolarEdge system.

What causes a fault in a PV system?

Faults in PVS are caused by: shading effects, module soiling, inverter failure, and mismatch due to variation in manufacturing or aging of PV modules (PVM). The main catastrophic failures in PV arrays (PVA) are: the line-to-line (LLF), ground (GF) and arc (AF) faults.

What happens if a fault occurs in a solar PV system?

Reduced real time power generation and reduced life span of the solar PV system are the results if the fault in solar PV system is found undetected. Therefore, it is mandatory to identify and locate the type of fault occurring in a solar PV system.

How do I troubleshoot a PV system with a ground fault?

Extreme caution must be used when troubleshooting PV systems with ground faults. To comply with NEN-EN-IEC 62446 test the string resistance using the insulation tester at 1000V. Every time the SolarEdge inverter enters operational mode and starts producing power, the resistance between the ground and the DC current-carrying conductors is checked.
