

The relationship between new energy and energy storage

Why do energy systems need more storage facilities?

Future energy systems require more storage facilities to balance the higher share of intermittent renewables in the upcoming power generation mix (Benato and Stoppato, 2018), especially as the demand for electric power could push capacity to 7200 GW by 2040 (International Energy Agency, 2014).

Do energy storage technologies provide flexibility in energy systems with renewable sources?

Storage technologies are a promising option to provide the power system with the flexibility required when intermittent renewables are present in the electricity generation mix. This paper focuses on the role of electricity storage in energy systems with high shares of renewable sources.

Why is energy storage important?

Energy storage is a potential substitute for, or complement to, almost every aspect of a power system, including generation, transmission, and demand flexibility. Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible.

Why is energy storage more cost-effective?

Moreover, increasing the renewable penetration or CO₂ tax makes energy storage more cost-effective. This is because higher renewable penetrations increase the opportunities to use stored renewable energy to displace costly generation from non-renewable resources.

What is energy storage?

Summary Energy storage is an enabling technology for rapid acceleration in renewable energy deployments. It enables flexibility to ensure reliable service to customers when generation fluctuates, whether over momentary periods through frequency regulation or over hours, by capturing renewable generation for use during periods of peak demand.

How does energy storage affect investment in power generation?

Energy storage can affect investment in power generation by reducing the need for peaker plants and transmission and distribution upgrades, thereby lowering the overall cost of electricity generation and delivery.
